

Patient Record Sharing for athenaClinicals

Connect across the continuum of care.

Patient Record Sharing helps providers exchange patient records with outside care sites and use those records to positively impact care. Built into athenaClinicals, Patient Record Sharing automatically searches the extensive network of care sites on CommonWell and Carequality, locates your patient's records, and surfaces those records directly in athenaNet so you have all the information you need in the moment of care.

The most universally connected network

The average primary care physician coordinates care with 229 other physicians working in 117 practices¹. To effectively coordinate care across diverse healthcare ecosystems, providers need the ability to seamlessly exchange patient records with critical care partners – regardless of the EMR in use. With 100,000+ providers on the athenahealth network and connections to thousands of care sites via CommonWell and Carequality, our providers have access to the most universally connected network in healthcare. Through CommonWell, we are able to connect athenahealth providers with care sites on Cerner, eClinicalWorks, McKesson, and more. And through our participation in Carequality, we can directly integrate athenahealth providers with Epic providers. In addition, our network will continue to grow over time as new sites are activated on CommonWell and Carequality and as athena adds new sites to its network.

Less effort and work

We build and maintain the connections to CommonWell and Carequality, so your IT teams don't have to. And with our cloud based platform, we can quickly activate our client sites on CommonWell and Carequality, giving them access to our network of care sites. In addition, we are constantly improving our solution to keep up with new means of sharing data and new government regulations. As a network-enabled service, we can build enhancements into our system and quickly roll out these changes to our entire client base.

Focused on your experience

We are focused not only on helping you access patient charts from outside care sites, but also on ensuring you can easily find and use the records in the moment of care. As soon as you open the patient chart, athenanet automatically searches care sites across the network for your patient's records and surfaces them directly in the chart – so you can spend less time on your computer and more time with your patient. We label the documents with key information such as provider name and document type, making it easy to quickly identify the records you are interested in reviewing. We also include notes from the previous physicians in the encounter summary records, giving you access to the most comprehensive view of your patient's care.

By the end of 2017, we'll be connected to:

100%
of eligible Epic sites
via Carequality

45%
of eligible Cerner sites
via CommonWell
