

One Platform, Multiple Clinical Use-Cases

The Rimidi Platform is a disease management tool that allows the patient and his or her physician to effectively manage diseases together. The comprehensive solution includes remote patient monitoring capabilities, patient reported outcomes collection, clinical decision support tools, disease management insights, and patient education, enabling healthcare providers to identify gaps in care management and the steps needed to close those gaps.

Disease Views are streamlined, problem-oriented screens providing a set of relevant clinical data along with guideline-based risk score(s) specific to a disease and a patient. Current disease views include:

-  **Diabetes**
-  **Hypertension**
-  **Heart Failure**
-  **Obesity**
-  **Respiratory**
-  **Fatty Liver**

Rimidi connects with various cellular-enabled medical devices to facilitate seamless remote monitoring of patients that doesn't require a hub, app or phone for the patient.

-  **Blood Glucose Monitors**
-  **Continuous Glucose Monitors***
-  **Blood Pressure Cuffs**
-  **Digital Scales**
-  **Pulse Oximeters**
-  **Digital Inhalers***

**Base enterprise subscriptions include one Disease View, with additional Disease Views available as add-ons for an additional monthly fee.*

**All device categories have a cellular-enabled option except CGMs and digital inhalers. These advanced sensors and digital therapeutics are prescribed by the patient's physician, and patient consent for connectivity to Rimidi is facilitated by the physician.*
